Research profile

Research economist and computational researcher with graduate training in economics, mathematics, and computer science. My proposed doctoral research studies how currency hierarchy, capital flows, and financing institutions distribute risk, investment authority, productive capability, and inequality across North–South relations, starting with infrastructure finance in Malawi’s energy sector. Previous work at the Ellison Institute of Technology, OECD, NBER, FAIR at the Norwegian School of Economics, and the World Inequality Lab spans quantitative modelling, policy evaluation, survey experiments, and large-scale data construction.

Education

Paris School of Economics <i>Master’s Degree in Economics, Public Policies and Development</i>	2021–2023 <i>Paris, France</i>
Stanford University <i>Master of Science in Computer Science</i>	2015–2017 <i>Stanford, CA, USA</i>
Stanford University <i>Bachelor of Science in Mathematical and Computational Science</i>	2012–2016 <i>Stanford, CA, USA</i>

Research experience

Ellison Institute of Technology, Oxford <i>Research Analyst under Prof. Andrew Scott</i>	Sep 2025–Aug 2026 <i>Oxford, UK</i>
--	--

- Built calibrated continuous-time and life-cycle models linking health investment to survival, labour supply, and long-run growth; used numerical simulation, comparative statics, and sensitivity analysis to compare mortality reductions across age groups.
- Built a reproducible Python pipeline for UKHLS panel data and applied unsupervised learning to recover latent life-cycle health trajectories linked to income, disability, mobility, and attrition; tested robustness and translated results into policy-facing analysis.

FAIR, Norwegian School of Economics (NHH) <i>Pre-Doctoral Research Fellow under Prof. Ingar Haaland</i>	Sep 2024–Jun 2025 <i>Bergen, Norway</i>
---	--

- Co-designed randomised field and survey experiments on demand for politically slanted news, combining treatment randomisation, generative AI, and computational text analysis to estimate effects on affective and political polarisation.
- Built an LLM-driven treatment platform and developed an open-source, Qualtrics-integrated [AI interviewer](#) for structured long-form qualitative data collection.

National Bureau of Economic Research <i>Research Assistant under Prof. Ellora Derenoncourt</i>	Jan–Aug 2024 <i>Cambridge, MA, USA / Princeton, NJ, USA</i>
--	--

- Contributed to Martínez and Derenoncourt’s paper [Market Forces and Employer Racial Preferences](#), identifying data sources and study variables and supporting difference-in-differences and event-study analysis.
- Built [Python and SLURM workflows](#) to process approximately 34 million OCR-derived historical job advertisements, extract offered wages and candidate employer locations, geocode addresses, and run reproducible batched jobs.

OECD <i>Research Consultant</i>	Aug 2023–Sep 2025 <i>Paris, France / Ljubljana, Slovenia</i>
---	---

- Evaluated active labour-market programmes with propensity-score matching on linked employment, health, and social-protection records; used machine learning to construct and validate a health index and estimate heterogeneous effects.

World Inequality Lab <i>Data Coordinator</i>	Apr–Jul 2023 <i>Paris, France</i>
--	--------------------------------------

- Containerised workflows, migrated processing to cloud infrastructure, and integrated SQL-based preprocessing, improving the reproducibility and scalability of inequality indicators published through [WID.world](#).

ConsiliumBots <i>Research Fellow under Prof. Christopher Neilson</i>	May–Sep 2022 <i>Santiago, Chile / New York, NY, USA</i>
--	--

- Supported [higher-education information interventions](#) with J-PAL LAC and built country-specific machine-learning career tools; later published an [independent synthetic-data reference implementation](#).

Selected research and policy writing

Master's thesis. *Did Inequality Fall in Chile? Income, Wealth, and Survey Disagreement, 2007–2024* Revised September 2026

Submitted September 2023; revised and extended data through 2024.

OECD report. *Does Slovenia's Public Works Programme Improve Health and Social Outcomes?* December 2025
Prepared with Matija Vodopivec.

Co-authored methods paper. *Robust Inference in the Presence of Weak Instruments* April 2022
With Kartika Herscheid and Unai Oyón-Lerga.

Co-authored policy note. *Addressing the Enduring Gender Gap in the Chilean Labour Market* March 2022
With Kartika Herscheid and Laure Lépine.

Selected public software and replications

LLM Experimental Economics Simulation — a code-first framework that reconstructs experimental-economics designs from public materials and audits heuristic or LLM simulations against empirical targets. It is a methodological framework, not an empirical result.

Colombia education CCT replication — a reproducible R replication of treatment effects from the Colombian conditional cash-transfer experiment using the authors' official package.

Basel transit investment analysis — a spatial-analysis demonstration combining Swiss GTFS and Basel-Stadt open data. The grant scenario is fictional; it demonstrates data integration, geocoding, transit-access metrics, and validation rather than policy evaluation.

Industry experience

Synapse 2017–2020
Machine Learning Engineer San Francisco, CA, USA

- Built and deployed computer-vision systems for identity verification and transaction classification in Python.
- Developed production APIs for financial risk, compliance, and fraud detection and trained generative models for adversarial testing.

Teaching and volunteering

TakenoLAB 2025
Teacher Dzaleka, Malawi

- Taught introductory computer science and programming; mentored projects in web development and machine learning.

Inspirit AI 2021–2024
Teacher Global

- Taught programming and core AI concepts; mentored AI-for-social-impact projects.

Stanford University 2014–2016
Mathematics Tutor Stanford, CA, USA

- Provided peer tutoring in linear algebra, calculus, and differential equations.

Methods, technical skills, and languages

Methods: Applied econometrics; causal inference; experimental design; panel and administrative data; structural and numerical modelling; computational text analysis; OCR/NLP; machine learning.

Programming: Python, R, Stata, SQL, Bash/Unix, C/C++, JavaScript.

Tools: AWS, GCS, OCI, Docker, Terraform, GitHub, L^AT_EX, Qualtrics.

Languages: English and Spanish (fluent); French (professional reading and writing, proficient speaking).
